

dBlue Acoustic Soil & Waste System

Enjoy silence

dBlue

aliaxis

Driven by comfort

Increased living standards have shaped modern installation regulations of drainage systems. Today, whether a consultant or installer, you need soil & waste solutions capable of responding to the commercial challenges faced by your clients' and end users' businesses. The drive for more:

Comfort of living

End users gain more comfort of living with Akatherm dBlue. The system is optimised for acoustic comfort using the latest production techniques, ensuring an installation that meets the most stringent noise regulations.

Speed of installation

A distinctive benefit of Akatherm dBlue is the fast installation. Easy to use and secured socket connections minimise installation time of each joint without further use of electrical tools.

Freedom of application

Its high resistance against heat and chemicals, unique products for high-rise, underground approval and dimension up to 200 mm enable Akatherm dBlue to be used as a single system installation in a broad range of applications.

Proven systems

akatherm dBlue is a high quality acoustic soil & waste system produced in conformity with the EN1451. It meets national and international quality and safety standards.

Fact:
Trend towards noise reduction

Higher living standards have dictated lower acceptable noise production of installed drainage systems. For instance an acceptable noise level in a 4-star hotel at night time is 25 dB.

Fact:
Fast building construction

Fast building constructions rely heavily on a time plan with strict deadlines for each part of the installation. A fast installation of the drainage system is therefore essential in meeting the overall construction planning.

Fact:
Increasing global standards

Wide spread accessibility of information has increased local awareness. Large construction companies take their practice across the world, thereby raising the minimum standards.

These particular challenges can only be overcome by a specialist drainage solution. Akatherm helps you to meet these demands with confidence.

Akatherm dBlue offers more than just an acoustic soil & waste system. Like every specialist drainage solution from Akatherm, it comes with a comprehensive level of support.

All our systems are backed by solid research, full training and unique products, plus the service standards you would expect from high performance drainage experts and the worldwide backing of the Aliaxis group.

Akatherm dBlue designed for noise reduction

The Akatherm dBlue system is made from a state-of-the-art combination of plastic and sound absorbing mineral filler (PP-MD) to maximise absorbance of sound. The material formula is developed by the Aliaxis R&D laboratory and offers a unique combination of acoustic performance, weight, resistance and mechanical strength.

The triple-layer pipe structure is produced using the latest co-extrusion technology. Each layer has its own function optimised to reduce sound levels, increase mechanical characteristics and improve the drainage flow.

Used in conjunction with the dBlue acoustic brackets, the system effectively uncouples the vibrations and greatly reduces noise and acoustic vibrations down to a level of 18 dB. This makes it ideal for residential housing, multi occupancy apartments as well as hospitals, hotels and other commercial buildings, where reduced noise levels are required.

State-of-the-art material formula

Latest co-extrusion technology

High noise reduction

Enjoy urban living

Akatherm dBlue is ideal for residential housing, multi occupancy apartments, high-rise as well as hospitals, hotels and other commercial buildings, where reduced noise levels are required.

Acceptable noise in our everyday surroundings

The acceptable noise level that a person can be exposed to while performing everyday activities and relaxing is described as 'the threshold noise level value'. Noise in drainage systems is generated by waste water falling vertically through downpipes as well as waste water in horizontal pipes running through concealed ceilings.

Structure-borne noise reduction

Structure-borne noise is effectively dampened by:

- dBlue acoustic bracket with rubber lining
- Tight rubber ring connection between pipe and fitting

Air-borne noise reduction

Air-borne noise is effectively reduced by:

- Pipe and fittings from PP-MD
- Triple layer pipe

Acceptable noise

Akatherm dBlue effectively reduces noise levels compared to the acceptable noise in our everyday surroundings:

- Habitable room at nighttime 25 dB
- Hospital wards at daytime 30 dB
- Non-habitable rooms daytime 40 dB
- **dBlue 18 dB**

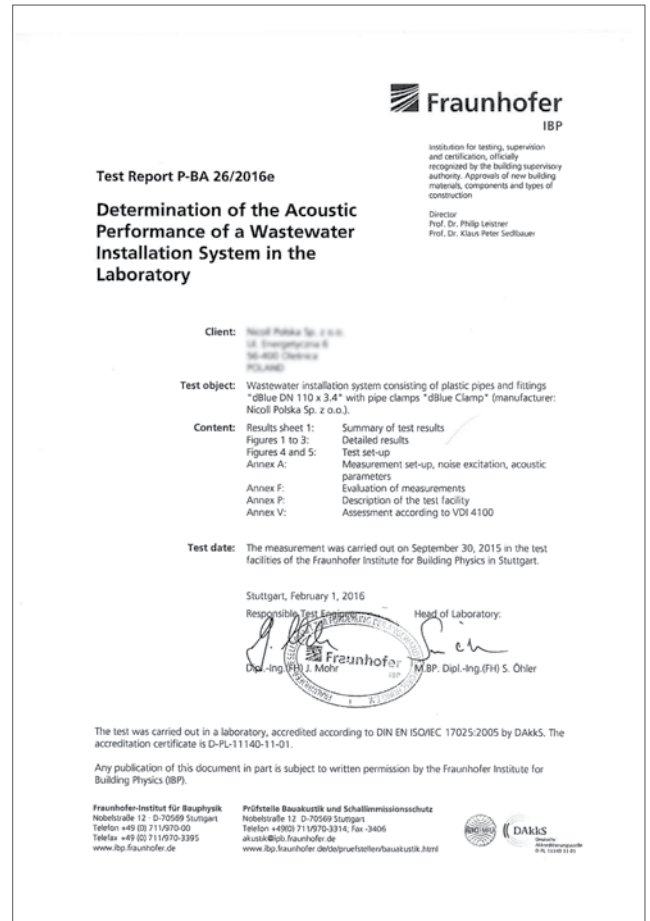

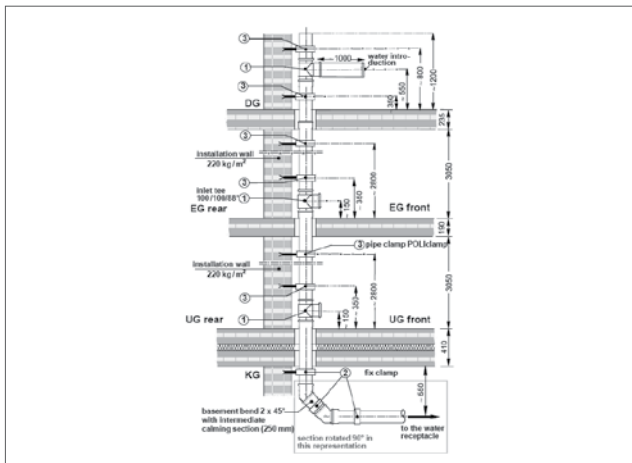

Proven results meeting strictest requirements

Tests and measurements of noise emitted by the Akatherm dBlue system were conducted according to the European standard EN 14366 'Laboratory measurement of noise from waste water installations'.

The Akatherm dBlue system is certified at a noise transmission level of 18 dB at a water flow of 4 l/s using dBlue acoustic brackets with rubber lining.

The 18 dB is measured at the bottom floor in the room next to the downpipe where the soil & waste flow and resulting noise levels are highest, especially in multi-storey living apartments or high-rise buildings that have a combined soil & waste flow.

All tests were carried out in the accredited institute for building physics Fraunhofer in Germany. Results are available in test report P-BA 26/2016e.

Quality and certification

Akatherm dBlue is developed and manufactured within an ISO 9001 Quality Assurance system and complies with the EN 1451 and other relevant international standards as well as meeting numerous national approved quality and safety standards.

Best placed in the race

Robust, complete and installation friendly

Material advantages

High noise reduction without insulation

High resistance to waste water temperatures up to 90°C (peak 95°C)

High chemical resistance ranging from pH2 to pH12

Triple layer pipe is rigid, noise-attenuated with a smooth bore that resists incrustation and blockages

Sustainable system 100% recyclable ISO 14001 certified company

Installation possible at temperatures down to -10°C

System advantages

dBlue acoustic brackets with rubber lining reduce acoustic vibrations to a minimum

Fast installation of rubber ring joints without additional tools

No vent stack required in multi-storey buildings using the Akavent single stack system

Transitions to PVC, PP-HT and HDPE possible without additional transition fittings required

Rubber ring joint increases flexibility of the pipe system during ground movement or earthquake

Snap cap technology with tight rubber ring containment and installation angle indication

One system from start to finish

Akatherm dBlue offers a versatile system with a superior application range. It will reach from the highest point in a skyscraper to the exit point of the building structure. The Akatherm dBlue system has the diameter range (40-200 mm), special fittings, acoustic performance, resistance, ring stiffness and installation advantage that makes it useable at any place in the building.
